

KOTTALA RISHI

Software Engineer — Java | Spring Boot | REST APIs | PostgreSQL | React

Hyderabad, India | +91 9951949353 | kottalarishi4@gmail.com | github.com/kottalarishi | linkedin.com/in/kottalarishi

SUMMARY

Backend-focused Software Engineer with production experience building scalable REST APIs using Java and Spring Boot. Independently shipped a full-stack property booking platform (AaoStays) — JWT/RBAC auth, PostgreSQL schema optimization, Cloudinary and SMTP integrations. Experienced in OOP, layered clean architecture, Agile workflows, and writing testable, maintainable code. Proficient with React for frontend development; comfortable with Docker basics and AWS fundamentals. Eager to contribute in a full-stack Java + React environment at GE Vernova.

TECHNICAL SKILLS

Languages	Java (primary), SQL, JavaScript
Backend	Spring Boot, Spring Security, Hibernate (JPA), REST APIs, JWT Authentication, Flyway, MapStruct
Databases	PostgreSQL, MySQL — schema design, indexing, query optimization, ACID transactions
Frontend	React.js, HTML, CSS — responsive design, component-based UI
DevOps / Tools	Git, GitHub, Maven, Postman, Docker (basics), AWS (S3/EC2 basics), Jenkins (basics)
Concepts	OOP, Clean Architecture, RBAC, Agile SDLC, REST Design, DB Normalization, System Design, Unit Testing

EXPERIENCE

Backend Developer Intern — AaoStays

Nov 2025 – Jan 2026 | Hyderabad, India

- Designed and implemented 20+ RESTful APIs supporting the full property booking lifecycle (search, availability, confirmation, cancellation) — production-deployed and serving real users.
- Built JWT-based authentication with Spring Security and fine-grained RBAC (User, Admin), securing all API endpoints from unauthorized access; mirrors enterprise security architecture.
- Designed normalized PostgreSQL schema with composite indexing on high-query columns, reducing average booking search query time by ~35%.
- Integrated Cloudinary API for property image management and SMTP for automated booking confirmation emails, eliminating manual admin effort.
- Optimized Hibernate fetch strategies (lazy vs eager loading), eliminating N+1 query issues and reducing unnecessary DB calls by ~40%.
- Implemented clean layered architecture (Controller → Service → Repository) enabling independent testability and maintainability — applied OOP principles throughout.
- Worked through Agile-style development cycles: scoped features, estimated effort, iterated based on feedback, and delivered a production-grade platform independently.

PROJECTS

Finance Dashboard System

Java 17, Spring Boot 3.x, Spring Security, JWT, PostgreSQL, Flyway, MapStruct | github.com/kottalarishi/finance_dashboard_system

- Built a secure finance backend with three-role RBAC (ADMIN, ANALYST, VIEWER) enforcing method-level permissions via `@PreAuthorize` — mirrors real-world fintech product architecture.
- Implemented stateless JWT auth with Spring Security — custom `UserDetails`, JWT filter chain, BCrypt password hashing; production-grade security following best practices.
- Designed financial records APIs with filtering by date, category, and type; dashboard summary APIs returning income, expenses, net balance, and monthly trends.
- Used Flyway for version-controlled DB migrations with seeded admin user — standard product engineering practice for schema evolution in Agile teams.
- Documented 8 architectural tradeoffs in README; included Postman collection for full API verification.

AaoStays — Property Booking Platform

Spring Boot, Spring Security, JWT, PostgreSQL, Hibernate, Cloudinary, React.js

- End-to-end backend for an Airbnb-style platform: property listing, availability search, and booking management — production-deployed, used by real property owners.

- JWT auth + RBAC with Spring Security; Cloudinary for media management; SMTP for transactional email automation.
- Relational schema with normalized tables, foreign key constraints, and indexed query paths for performant lookups at scale.
- Modular, testable layered architecture — designed for horizontal scaling and independent service evolution; integrates React.js frontend.

URL Shortener Service

Spring Boot, PostgreSQL, Base62 Encoding

- Built URL shortening service with Base62 encoding generating compact unique identifiers; indexed schema enables near-constant-time redirect resolution.
- Redirect API with validation, expiry checking, and error handling; architecture designed for horizontal scale — suitable for system design discussion (mirrors bit.ly model).

EDUCATION

B.Tech — Electrical & Electronics Engineering

Sree Dattha Institute of Engineering & Science | 2024 | CGPA: 7.01

CERTIFICATIONS

Java Full Stack Development — Qspiders, 2025
